SUMMARY

DevOps engineer finishing a two-year vocational programme at Jensen Yrkeshögskola in May 2026. Eight months of internship experience in infrastructure, CI/CD, and container orchestration on GCP and Kubernetes. Graduation thesis benchmarks VM versus Kubernetes execution for Dagster pipeline orchestration, building on K8sRunLauncher research done during the internship. Uses GitHub Copilot and Claude daily; reviews AI output carefully before committing, especially for infrastructure and permissions changes.

TECHNICAL SKILLS

AI & Dev Tools: GitHub Copilot, Claude, ChatGPT, Prompt Engineering, AI Code Review

DevOps & Platform: Docker, Kubernetes / GKE, Helm, GitHub Actions, Dagster, dbt, ArgoCD, OpenShift, Podman, GitLab

IaC & Cloud: Terraform / CDKTF (Python), GCP, Azure, BigQuery, GCS, Artifact Registry, IAM, Infisical

Programming: Python, Bash, Go, SQL, PHP

Linux & Infra: Linux Admin, Nginx, TCP/IP, pfSense, PostgreSQL, MySQL, BareOS, Supabase

EXPERIENCE

DevOps Engineer (Intern)
Sep 2025 – May 2026

Insighta Inc · Malmö, Sweden

- Researched `K8sRunLauncher` as a path to zero-downtime Dagster deploys. Tested GCS log persistence across container restarts, documented findings, and presented them to the team.
- Scoped the Kubernetes configuration needed to host the Dagster instance itself on GKE. Documented the approach and refined follow-up tickets with the team.
- Configured the Docker run launcher so each pipeline job runs in its own container. Dagster can now be redeployed without interrupting jobs in progress.
- Built Helm chart templates for Dagster on GKE: Workload Identity, RBAC, and cross-project Artifact Registry access.
- Fixed a series of GCP IAM issues blocking CI/CD and GKE deployments: Artifact Registry permissions, GCS write access for logs, and GitHub Actions rights to manage cluster resources.
- Refactoring the Docker Compose setup into five production services (postgres, webserver, daemon, two code-location servers), replacing `dagster dev` in live environments.
- Used GitHub Copilot and Claude throughout the internship for Helm templates, IAM debugging, and documentation. Reviewed all AI output before committing, particularly for permissions-related changes.

IT Support Engineer (Intern)
Mar – May 2024

ReDi School of Digital Integration · Malmö, Sweden

- Provided day-to-day IT support for staff and students across Windows and Linux machines.
- Configured laptops, classroom equipment, and peripherals for teaching environments.
- Wrote troubleshooting documentation so common issues could be resolved without escalating.

IT Infrastructure Engineer
2019 – 2020

High Security Printing House

- Set up and maintained Windows/Linux servers, VMs, and BareOS backup systems in a secure environment.
- Acted as the contact point between technical staff and other departments for IT and access issues.

PHP Developer
Sep – Dec 2017

Development and Registry Addressing Service

- Built and maintained internal web tools; fixed bugs and made minor performance improvements.

SELECTED PROJECTS

Dagster Deployment Architecture — Research to Production
Dagster · Docker · GKE · Helm · GitHub Actions · GCP

Eight months of linked tickets improving how Dagster is deployed. Ran two research spikes: `K8sRunLauncher` for zero-downtime deploys, and hosting Dagster itself on GKE. Implemented the Docker run launcher to isolate pipeline jobs from the Dagster process. A GKE and Helm approach was explored and abandoned; the findings directly shaped the current Docker Compose refactor into five production services.

GCP IAM & Permissions Hardening
GCP · Artifact Registry · GCS · Terraform CDKTF · GitHub Actions

Fixed permission gaps blocking CI/CD and GKE deployments across multiple PRs: Artifact Registry access across projects, GCS write access for compute logs, and GitHub Actions rights to manage cluster resources. Contributed to Python CDKTF modules that provision IAM roles per client project.

When Does Kubernetes Become Worth It? *(Graduation Thesis, in progress)*
Dagster · Kubernetes · Kind · GKE · Helm · UTM · Python · Docker

Empirical comparison of VM Docker executor (DockerRunLauncher) versus Kubernetes Run Launcher for Dagster, measuring how reliability and performance change under increasing concurrent workload. Core contribution: identifying the *crossover point* where Kubernetes becomes net beneficial despite scheduling overhead. Three experiments, six concurrency levels, local infrastructure (Multipass VM vs. Kind cluster). Built on the K8sRunLauncher spike from the internship. Jensen Yrkeshögskola, May 2026.

EDUCATION & CERTIFICATIONS

DevOps Engineer — Jensen Yrkeshögskola, Sweden *2024 – 2026 (exp.)*
Graduation thesis: *When Does Kubernetes Become Worth It?* — empirical study of VM-to-K8s migration for workflow orchestration

IT Administration — Technical University of Berlin *2018*

B.Sc. Information Technology — Polytechnic University *2013 – 2016*

Microsoft Azure Fundamentals | Red Hat OpenShift Admin I | Cisco IT Essentials
